

Design an employee class. Each employee has a name, a title, an office and a boss. Then design some subclasses, hourly, monthly and contract. What extra slots do you want for these?

The methods we want are, show (or print), generic functions to access the slots. Implement a `bossOf` method. Can you think of how to get *the big cheese*? Can you have a method that prints out the monthly wage for the given employee? What do you need to know to do this?

Create an employee for each member of your programming team. Use them to test out your methods.
