## Statistics 120 Using Colour

## Light and Dark Contrast

- The basic structure of any image is conveyed by the light and dark contrast in the image.
- This information is conveyed by the basic $R+G+B$ channel from the eye to the brain. Additional colour information is conveyed by the $R-G$ and $Y-B$ channels.
- When the $R-G$ and $Y-B$ channels are removed, the structure present in an image is still visible.
- When the light-dark contrast information is removed, the structure of images is much less apparent.

## Full Colour Information

## Hue Information Removed

## Contrast Reduced

## Basic Contrast Rules

- Draw with dark colours on light backgrounds.
- Draw with light colours on dark backgrounds.

## Contrast And Boundaries

- Use colours of contrasting lightness to emphasize boundaries between colours of similar lightness.

## Red and Blue

- Red and Blue are at opposite ends of the visible spectrum.
- They are refracted different amounts by the lens of the eye.
- Most people cannot bring Red and Blue into focus simultaneously.
- Most people see red as being in font of blue, a smaller group see blue in front of red and a few special individuals see them as being at the same distance.

## Pseudo-Stereopsis and the Optical Axis

Red Advances, Blue Receeds

No Effect

## Red and Blue Together

## Blue On Red Hurts Your Head

Red On Blue Makes You Spew

Purple Is A Mixture Of Red And Blue It Is Hard To Focus On

## Blue

- There are relatively few blue cone cells in the fovea.
- It is harder to see fine detail when it is presented in blue.
- Blue is best used as a background colour.
- The blue cone cells have the slowest response to light changes.
- It it hard to see blue objects in motion.

## Colour Intensity

- Extended exposure to very bright colours bleaches the light sensitive pigments in the eye's cone cells.
- This makes the eye tired.
- Don't use large areas of saturated colour in displays which need to be studied for extended periods.
- Small amounts of saturated colour are alright because the sacades of the eye means that the colour does not rest for long on the same cone cells.

## Common Uses For Colour

- Encoding a numerical scale.
- Encoding an ordered scale.
- Differentiating or grouping graphical elements.
- Making dull plots look interesting.

## Encoding Numerical Values

- We find it hard to decode numerical values from colour (Cleveland and McGill).
- Research at IBM has shown that luminance is the only effective colour-based way of encoding numercial information.
- The use of a rainbow encoding is common, but misleading. (Hues form a circle, not a straight line).
- Colour can be effective when used in conjunction with light cues.

## Color-Based Numerical Encodings

All examples use luminance together with colour.

## Differentiating or Grouping Graphical Elements

```

## Choosing Colours

- Humans can distinguish millions of distinct colours.
- The size of this "search space" makes it difficult to find good colour combinations.
- The problem is even tougher because colours change their appearance when displayed together with other colours.
- Choosing colours "randomly" seems to produce very bad results (as does choosing random musical tones).
- Some guidance can be found in the principles of colour harmony.

## Colour Harmony Advice From Artists

- Books on the graphic arts offer some advice on how to choose "good" combinations of colours. Some suggestions are to use:
- Analogous colours.
- Complementary colours.
- Triads.
- Tetrads.
- These are typically described in terms of colour wheels.

## An HSV Colour Wheel

## An CIELUV Colour Wheel

$h c l(h=\operatorname{seq}(0,330, b y=30), c=59, l=75)$

## Analogous Colours

## Complementary Colours

## Colour Triad

## Colour Tetrad

## Choosing Colours From Colour Wheels

Generating $n$ equally spaced hues using hsv.

$$
\begin{aligned}
>\operatorname{hsv}(\mathrm{h} & =\operatorname{seq}(0,1, \text { length }=\mathrm{n}+1)[1: \mathrm{n}], \\
\mathrm{s} & =1, \mathrm{v}=1)
\end{aligned}
$$

Generating n equally spaced hues using hcl.

$$
\begin{aligned}
>\operatorname{hcl}(\mathrm{h} & =\operatorname{seq}(0,360, \text { length }=\mathrm{n}+1)[1: \mathrm{n}], \\
\mathrm{c} & =59,1=75)
\end{aligned}
$$

Note that hcl is not a built-in part of R (yet). It is contained in a library called colorspace which is installed in the University labs and available from the class web site.

## Computer Science Graduations

| Year | Winter | Spring | Summer | Fall |
| :--- | ---: | ---: | ---: | ---: |
| 72 | 4 | 2 | 4 | 6 |
| 73 | 4 | 3 | 1 | 4 |
| 74 | 4 | 7 | 7 | 1 |
| 75 | 0 | 7 | 3 | 2 |
| 76 | 4 | 5 | 3 | 2 |
| 77 | 5 | 4 | 2 | 2 |
| 78 | 3 | 1 | 3 | 0 |
| 79 | 4 | 4 | 6 | 7 |
| 80 | 1 | 10 | 8 | 7 |
| 81 | 1 | 5 | 3 | 2 |
| 82 | 1 | 5 | 2 | 1 |
| 83 | 4 | 1 | 4 | 3 |
| 84 | 0 | 3 | 0 | 6 |
| 85 | 2 | 1 | 5 | 5 |

## HSV Colours - Tetrad

## CIELUV Colours - Tetrad

## CIELUV Colours - Analagous

## Monchrome HSV Colours

## Metaphorical Colours

$h c l(h=c(240,180,120,60), c=59, l=75)$
