

Writing New Graphics Functions in R Using **grid**

Paul Murrell

The University of Auckland

Introduction

Writing New
Graphics
Functions in R
Using **grid**

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

- **grid** provides a **low-level** graphics system.
- In the beginning, only **lattice** provided high-level plots based on **grid**, but some others are starting to appear—e.g., **hexbin** and **vcd**.
- **grid** provides support for producing high-level plots that are more flexible and reusable than the existing “traditional” plots.
- The aim of this talk is to make sure that **grid**’s features are fully exploited.
- The ultimate goal is to encourage the development of functions that produce **graphical components** that can be reused and recombined.

Overview

Writing New
Graphics
Functions in R
Using **grid**

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

- A brief revision of important **grid** concepts.
 - Rpseudo-code examples
- Writing graphics functions.
 - Support for embedding graphical components.
 - Support for annotating graphical components.
 - Support for customizing graphical components.
- Writing graphics classes.

grid Basics

Writing New
Graphics
Functions in R
Using `grid`

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

- **grid** provides a standard set of **graphical primitives**.

```
grid.rect(...)  
grid.lines(...)  
grid.polygon(...)  
grid.circle(...)  
grid.text(...)
```

grid Basics

- Graphical output can be positioned and sized relative to a large number of coordinate systems.

```
grid.rect(x=unit(0, "native"),  
          y=unit(1.5, "lines"),  
          height=unit(0.5, "inches"),  
          ...)
```

grid Basics

Writing New
Graphics
Functions in R
Using `grid`

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

- All drawing occurs in the current **grid viewport**.

```
grid.text("centre")  
pushViewport(viewport(...))  
grid.text("centre")  
popViewport()
```

centre

centre

grid Basics

Writing New
Graphics
Functions in R
Using `grid`

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

- **grid** creates graphical objects (**grobs**) representing the graphical output.

```
grid.rect(..., name="background")  
grid.circle(...)
```

```
grid.remove("background")
```

Writing graphics functions

- Consider a function that draws a boxplot.

```
x <- rexp(50)  
gBoxplot(x)
```

Writing graphics functions

- A boxplot is just a rectangle, some lines, and possibly some points.

```
gboxplot <- function(...) {  
  # inter-quartile range  
  grid.rect(...)  
  # median and whiskers  
  grid.lines(...)  
  grid.lines(...)  
  # outliers  
  if (outliers)  
    grid.points(...)  
}
```

Embedding

Writing New
Graphics
Functions in R
Using `grid`

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

- Always draw in the current viewport.
Do not assume you own the entire page.

```
pushViewport(...)  
gBoxplot(x, newpage=FALSE)  
popViewport()
```

Embedding

- Avoid absolute units. Will your output scale nicely?
Only use absolute units if you have a good reason.

```
pushViewport(...)  
gBoxplot(x1, ...)  
gBoxplot(x2, ...)  
gBoxplot(x3, ...)  
popViewport()
```

A Lattice Example

Writing New
Graphics
Functions in R
Using `grid`

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

```
lplot <- xyplot(...)  
pushViewport(...)  
print(lplot, newpage=FALSE)  
popViewport()
```

Annotating

Writing New
Graphics
Functions in R
Using `grid`

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

- Use `upViewport()` not `popViewport()`.
Leave your viewports for others to use.
- Name your viewports.
Make it easy for others to navigate within the coordinate systems that you create.

A “Bloated Boxplot” Example

Writing New
Graphics
Functions in R
Using `grid`

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

```
gBloatedBoxplot <- function(...) {  
  # inter-quartile range and median  
  pushViewport(viewport(..., name="IQR"))  
  grid.rect(...)  
  grid.lines(...)  
  upViewport()  
  # median and whiskers  
  grid.lines(...)  
  # outliers  
  if (outliers)  
    grid.points(...)  
}
```

A “Bloated Boxplot” Example

Writing New
Graphics
Functions in R
Using `grid`

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

```
gBloatedBoxplot(x)  
current.vpTree()
```

```
viewport [ROOT] -> (viewport [IQR])
```

A “Bloated Boxplot” Example

Writing New
Graphics
Functions in R
Using `grid`

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

```
gBloatedBoxplot(x)  
downViewport("IQR")  
grid.segments(...)  
upViewport()
```

A Lattice Example

Writing New
Graphics
Functions in R
Using `grid`

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

```
xyplot(x ~ 1:50)  
current.vpTree()
```

```
viewport [ROOT] -> (  
  viewport [plot1.toplevel.vp] -> (  
    viewport [plot1.],  
    viewport [plot1.panel.1.1.off.vp],  
    viewport [plot1.panel.1.1.vp],  
    viewport [plot1.strip.1.1.off.vp],  
    viewport [plot1.xlab.vp],  
    viewport [plot1.ylab.vp]))
```

A Lattice Example

Writing New
Graphics
Functions in R
Using `grid`

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

```
xyplot(1:50 ~ x)  
downViewport("plot1.panel.1.1.off.vp")  
gBoxplot(x, ..., newpage=FALSE)  
upViewport(0)
```

Customizing

Writing New
Graphics
Functions in R
Using `grid`

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

- Name your graphical objects.
Avoid having to provide arguments for every piece within your graphic.

These are *some* of the arguments accepted by the traditional `bxp()` function:

```
boxlty boxlwd boxcol boxfill  
medlty medlwd medpch medcex medcol medbg  
whisklty whisklwd whiskcol  
staplelty staplelwd staplecol  
outlty outlwd outpch outcex outcol outbg
```

Make it easy/possible for others to access the objects that you create.

The Simple Example

Writing New
Graphics
Functions in R
Using `grid`

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

```
gboxplot <- function(...) {  
  # inter-quartile range  
  grid.rect(..., name="IQR")  
  # median and whiskers  
  grid.lines(..., name="median")  
  grid.lines(..., name="whiskers")  
  # outliers  
  if (outliers)  
    grid.points(..., name="outliers")  
}
```

Customizing

Writing New

Functions in R
Using `grid`

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

```
gBoxplot(x)  
grid.edit("IQR", ...)  
grid.edit("median", ...)  
grid.edit("whiskers", ...)  
grid.edit("outliers", ...)
```

A Lattice Example

Writing New
Graphics
Functions in R
Using `grid`

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

These are *some* of the arguments accepted by the `xypplot()` function:

```
formula, data, panel,  
allow.multiple, outer, aspect, as.table,  
between, groups, key, auto.key, legend,  
layout, main, page, par.strip.text,  
prepanel, scales, skip, strip,  
sub, xlab, xlim, ylab, ylim,  
drop.unused.levels, par.settings,  
perm.cond, index.cond, default.scales,  
panel.groups, subscripts, subset
```

A Lattice Example

Writing New
Graphics
Functions in R
Using `grid`

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

```
xyplot(x ~ 1:50)  
getNames()
```

```
[1] "GRID.GROB.1634" "plot1.xlab"  
[3] "plot1.ylab"      "GRID.GROB.1635"  
[5] "GRID.GROB.1636" "GRID.GROB.1637"  
[7] "GRID.GROB.1638" "GRID.GROB.1639"  
[9] "GRID.GROB.1640" "GRID.GROB.1641"  
[11] "GRID.GROB.1642"
```

Hierarchical graphical objects (gTrees)

- Graphical objects can be combined to form hierarchies.

```
gTreeBoxplot <- function(...) {  
  grid.draw(  
    gTree(children=gList(rectGrob(...),  
                          linesGrob(...),  
                          linesGrob(...),  
                          pointsGrob(...)),  
          ...))  
}
```

A hierarchical boxplot

```
gTreeBoxplot(x1, ..., name="boxplot")  
getNames()
```

```
[1] "boxplot"
```

```
childNames(grid.get("boxplot"))
```

```
[1] "IQR"      "median"   "whiskers"  
[4] "outliers"
```

New Graphics Classes (and Methods)

- A graphical object can be given a class, which allows a high-level interface to be defined.

```
gTreeBoxplot <- function(x, at, ...) {  
  grid.draw(  
    gTree(children=gList(rectGrob(...),  
                          linesGrob(...),  
                          linesGrob(...),  
                          pointsGrob(...)),  
          x=x, at=at, ..., cl="gBoxplot"))  
}  
editDetails.gBoxplot <- function(...) {  
  ...  
}
```

A boxplot class

```
gClassBoxplot(x, at=0.25, ...,  
              name="boxplot")  
grid.edit("boxplot", at=0.75)
```

Summary

Writing New
Graphics
Functions in R
Using `grid`

Paul Murrell

Introduction

Grid Basics

Graphics
Functions

Embedding

Annotating

Customizing

Graphics
Classes

- New graphics functions are easy
- Make sure others can ...
 - ... **embed** your output
 - ... **annotate** your output
 - ... **customize** your output
- New graphics classes are possible
