## Introductory Exercises

Gross Domestic Product (GDP) is the total market value of goods and services produced in a country within a given period. The percentage growth of GDP is usually used as an important measurement of the economic growth of a country. Shown below is an estimate of percentage growth in GDP for 1998 and the forecast for 2000 for some South-East Asian and Pacific countries.

|  | A | B | C | D | E | F | G | H | I | J | K |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 |  | Australia | China | Hong Kong | Japan | Malaysia | New Zealand | Philippines | Singapore | South Korea | Taiwan |
| 2 | 1998 | 2.8 | 6.1 | 3.5 | -2.3 | -0.6 | 0.5 | 1.4 | -0.5 | -1.2 | 4.6 |
| 3 | 2000 | 2.5 | 7.4 | 5.3 | 1 | 2.1 | 1.8 | 3.6 | 3.1 | 7.1 | 4.9 |

Figure 1

## Task 1 ENTERING INFORMATION

1. Type the data as in Figure 1.

## Task 2 COPYING AND PASTING INFORMATION

2. Select cells from A1 to K3 and click Copy on the Standard toolbar.
3. Click Sheet 2 on the Sheet tabs. (This is a new worksheet in the same workbook as the original worksheet. To go back the original worksheet, click Sheet 1 on the Sheet tab.)
4. Click cell A1.
5. On the Menu bar, click Edit £ Paste Special.
6. Select the Transpose check box. (Figure 2)
7. Click OK. It will give the table as shown in Figure 3.

Figure 2

|  | A | $\mathbf{B}$ | $\mathbf{C}$ |
| :---: | :--- | :---: | :---: |
| $\mathbf{1}$ |  | 1998 | 2000 |
| $\mathbf{2}$ | Australia | 2.8 | 2.5 |
| $\mathbf{3}$ | China | 6.1 | 7.4 |
| $\mathbf{4}$ | Hong Kong | 3.5 | 5.3 |
| $\mathbf{5}$ | Japan | -2.3 | 1 |
| $\mathbf{6}$ | Malaysia | -0.6 | 2.1 |
| $\mathbf{7}$ | New Zealand | 0.5 | 1.8 |
| $\mathbf{8}$ | Philippines | 1.4 | 3.6 |
| $\mathbf{9}$ | Singapore | -0.5 | 3.1 |
| $\mathbf{1 0}$ | South Korea | -1.2 | 7.1 |
| $\mathbf{1 1}$ | Taiwan | 4.6 | 4.9 |
| $\mathbf{1 2}$ |  |  |  |
| $\mathbf{1 3}$ |  |  |  |
| $\mathbf{1 4}$ |  |  |  |
| $\mathbf{1 5}$ |  |  |  |
| $\mathbf{1 6}$ |  |  |  |
| $\mathbf{1 7}$ |  |  |  |

Figure 3

## Task 3 ENTERING FUNCTION

8. In cell A12, type Total.
9. In cell B12, type $=\mathbf{S U M}(\mathbf{B} 2:$ B11 $)$ and press Enter key on the keyboard.

Note: In Excel, a formula starts with an equal sign (=) and it will not be calculate until the Enter key has been pressed.
10. Select cell B12.
11. Click its Fill Handle (Figure 4) and hold down - do NOT release the mouse button.

| 10 | South Korea | -1.2 | 7.1 |
| :--- | :--- | :---: | :---: |
| 11 | Taiwan | 4.6 | 4.9 |
| $\mathbf{1 2}$ | Total | 14.3 |  |
| 13 |  |  |  |

Figure 4
12. Drag the Fill Handle to the cell C12 and release the mouse button. Notice that the cell C12 contains the formula $=\mathbf{S U M}(\mathbf{C 2}: \mathbf{C 1 1})$ now.

Note: This skill can also be used to fill in a series of numbers, dates, same content, or other items. Use Office Assistance or Help file to learn them.
13. In cell A13, type Mean.
14. In cell B13, type AVERAGE(B2:B11).
15. In cell C13, use the skill described in step 11 and 12 to find the average GDP growth of all countries for year 2000.

## Task 4 ENTERING FORMULA

16. In cell D1, type Difference.
17. In cell D2, type $=\mathbf{C} 2-\mathbf{C 3}$.
18. Use the skill described in step 11 and 12 to find the difference in GDP growth between 1998 and 2000 for each country. The table should look like in Figure 5.

|  | A | B | C | D |
| :--- | :--- | :---: | :---: | :---: |
| $\mathbf{1}$ |  | 1998 | 2000 | Difference |
| $\mathbf{2}$ | Australia | 2.8 | 2.5 | -0.3 |
| $\mathbf{3}$ | China | 6.1 | 7.4 | 1.3 |
| $\mathbf{4}$ | Hong Kong | 3.5 | 5.3 | 1.8 |
| $\mathbf{5}$ | Japan | -2.3 | 1 | 3.3 |
| $\mathbf{6}$ | Malaysia | -0.6 | 2.1 | 2.7 |
| $\mathbf{7}$ | New Zealand | 0.5 | 1.8 | 1.3 |
| $\mathbf{8}$ | Philippines | 1.4 | 3.6 | 2.2 |
| $\mathbf{9}$ | Singapore | -0.5 | 3.1 | 3.6 |
| $\mathbf{1 0}$ | South Korea | -1.2 | 7.1 | 8.3 |
| $\mathbf{1 1}$ | Taiwan | 4.6 | 4.9 | 0.3 |
| $\mathbf{1 2}$ | Total | 14.3 | 38.8 |  |
| $\mathbf{1 3}$ | Mean | 1.43 | 3.88 |  |

Figure 5

## Task 5 SORTING DATA

19. Select cells from A1 to D11.
20. On the Menu bar, click Data $£$ Sort.
21. In Sort dialog box, click the arrow button and choose Difference from the list.
22. In Sort By box, choose Descending. (Figure 6)
23. Click OK. Now the table is arranged according to the difference of GDP growth in descending order and should look like in Figure 7.

Note: If the column specified in the Sort By box has duplicate items, the values can be sorted by specifying another column in the Then By boxes. In this example, China and New Zealand have the same difference of GDP growth. If after step 22, we set the first Then By box as 2000 and Ascending, then click OK. We will have table as in Figure 7 except that New Zealand is arranged before China.

|  | A | $\mathbf{B}$ | $\mathbf{C}$ | $\mathbf{D}$ |
| :---: | :--- | :---: | :---: | :---: |
| $\mathbf{1}$ |  | 1998 | 2000 | Difference |
| $\mathbf{2}$ | South Korea | -1.2 | 7.1 | 8.3 |
| $\mathbf{3}$ | Singapore | -0.5 | 3.1 | 3.6 |
| $\mathbf{4}$ | Japan | -2.3 | 1 | 3.3 |
| $\mathbf{5}$ | Malaysia | -0.6 | 2.1 | 2.7 |
| $\mathbf{6}$ | Philippines | 1.4 | 3.6 | 2.2 |
| $\mathbf{7}$ | Hong Kong | 3.5 | 5.3 | 1.8 |
| $\mathbf{8}$ | China | 6.1 | 7.4 | 1.3 |
| $\mathbf{9}$ | New Zealand | 0.5 | 1.8 | 1.3 |
| $\mathbf{1 0}$ | Taiwan | 4.6 | 4.9 | 0.3 |
| $\mathbf{1 1}$ | Australia | 2.8 | 2.5 | -0.3 |
| $\mathbf{1 2}$ | Total | 14.3 | 38.8 |  |
| $\mathbf{1 3}$ | Mean | 1.43 | 3.88 |  |

Figure 7

Figure 6

## Task 6 CREATING CELL NAMES:

Sometimes it is useful to refer to cells by a name like 'sample_mean' rather than a row column reference, eg like B24.

## Naming One Cell:

Eg, name the cell B24 'sample_mean'.

1. Select the cell B24.
2. Move the cursor to the Name Box in the top left of your screen and click the mouse button when the cursor is over the box.

Figure 8
3. The Name Box should now be highlighted. Type sample_mean.
4. Press the Enter key. The Name Box should now contain sample_mean and will look like Figure 9 below.

Figure 9

Eg, naming cells B2:B4, 'Bobs_age', 'Marys_age', and 'Jacks_age', as these cells contain the age of the respective person.

1. Type the entries into cells $\mathrm{A} 1: \mathrm{B} 4$ and select cells $\mathrm{A} 2: \mathrm{B} 4$, as seen in Figure 10.

Figure 10
2. On the menu bar click Insert £ Name £ Create...
3. A dialog box is brought up, as in Figure 11. The names to be created are in the left column, select the Left Column check box.

Figure 11
4. Click OK. The cells have now been named.

Example: Construct a dotplot for the Cancer Data.

1. Input the data into Excel. Notice that 1, 2, and 3 in Column $\mathbf{A}$ represent "Stomach", "Bronchus", "Colon" respectively.
(See Figure 1 on the right)
2. Highlight the cells A1:B30 and click Chart Wizard.
3. Choose XY(Scatter) in Chart type box and first option in Chart sub-type box.
4. Click Next. (See Figure 2 below)

Figure 2

|  | A | B |
| :---: | :---: | :---: |
| 1 | 1 | 1.18 |
| 2 | 1 | -0.41 |
| 3 | 1 | -0.64 |
| 4 | 1 | 1.32 |
| 5 | 1 | 1.39 |
| 6 | 1 | 0.14 |
| 7 | 1 | 2.29 |
| 8 | 1 | -0.1 |
| 9 | 1 | 2.2 |
| 10 | 1 | 3.83 |
| 11 | 2 | 0.81 |
| 12 | 2 | 3.16 |
| 13 | 2 | -0.22 |
| 14 | 2 | 2.05 |
| 15 | 2 | 1.9 |
| 16 | 2 | 0.85 |
| 17 | 2 | 0.27 |
| 18 | 2 | 0.73 |
| 19 | 2 | 1.84 |
| 20 | 2 | 3.86 |
| 21 | 3 | 2.01 |
| 22 | 3 | 0.51 |
| 23 | 3 | 1.07 |
| 24 | 3 | 4.31 |
| 25 | 3 | 1 |
| 26 | 3 | 3.51 |
| 27 | 3 | 3 |
| 28 | 3 | 1.79 |
| 29 | 3 | 1.67 |
| 30 | 3 | 2.16 |

Figure 1

## 5. Click Next.

Figure 3
6.Enter the titles in the Chart Title, Value (X) Axis, and Value (Y) axis. (Figure 3 on the right hand side).
7 . Click Finish. Your plot should look like Figure 4 below.
The Dotplot of Cancer Data

Figure 4
8. By using textboxes and by double clicking each axis, it is possible to format the axes to produce a plot as in Figure 5 below.

The Dotplot of Cancer Data

Figure 5

## Calculating Binomial Probabilities

## A. Individual probabilities: $\operatorname{pr}(X=x)$

Example: Find $\operatorname{pr}(X=5)$ where $X \sim \operatorname{Binomial}(8,0.6)$

1. Click cell A1.
2. Click the Paste Function button
3. Choose Statistical from the
from the tool bar.
Function category list box in the Paste Function dialog box.
4. Choose BINOMDIST from the Function name list box (Figure 1).

Figure 1
5. Click OK.
6. Fill in the BINOMDIST dialog box (Figure 2).

Figure 2
where:
Number_s is the number of successes in trials. It is equivalent to $x$ in our manual. In this example, we put 5 in this box.

Trials is the number of trials. It is equivalent to $n$ in our manual. In this example, we put 8 in this box.

Probability_ is the probability of success in each trial. It is equivalent to $p$ in our manual. In this
s example, we put 0.6 in this box.
Cumulative indicates whether the number of successes is cumulative (TRUE or 1) or not(FALSE or 0). Since the individual probability is not cumulative, we put FALSE in this box.
7. Click OK. (The value of 0.279 should appear in cell A1).

## B. Lower tail probabilities: $\operatorname{pr}(X \leq x)$

Example: Find $\operatorname{pr}(X \leq 3)$ where $X \sim \operatorname{Binomial}(8,0.6)$

1. Click cell B1.
2. Follow Steps 1 to 4 in A.
3. Set: Number_s $=3$

Trials $=8$
Probability_s $=0.6$
4. The lower tail probability is cumulative, hence we set

Cumulative $=$ TRUE.
5. Click OK. (The value of 0.174 should appear in cell B1).
C. Upper tail probabilities: $\operatorname{pr}(X \geq x)$

Example: Find $\operatorname{pr}(X \geq 3)$ where $X \sim \operatorname{Binomial}(8,0.6)$
Note: $\quad \operatorname{pr}(X \geq 3)=1-\operatorname{pr}(X \leq 2)$

1. Evaluate $\operatorname{pr}(X \leq 2)$ in cell C 1 (use steps in B ).
2. In cell C2, type: $=\mathbf{1 - C 1}$.
3. Press Enter. (The value of 0.950 should appear in cell C2).
D. $\mathbf{p r}(\mathbf{a} \leq X \leq \mathbf{b})$

Example: Find $\operatorname{pr}(3 \leq X<7)$ where $X \sim \operatorname{Binomial}(8,0.6)$
Note: $\quad \operatorname{pr}(3 \leq X<7)=\operatorname{pr}(3 \leq X \leq 6)=\operatorname{pr}(X \leq 6)-\operatorname{pr}(X \leq 2)$

1. Evaluate $\operatorname{pr}(X \leq 6)$ in cell D 1 (use steps in B ).
2. Evaluate $\operatorname{pr}(X \leq 2)$ in cell D 2 (use steps in B ).
3. In cell D3, type: $=\mathbf{D} 1 \mathbf{-} \mathbf{D} 2$.
4. Press Enter. (The value of 0.844 should appear in cell D3).

## Note:

Another way to calculate Binomial probabilities is to type the function " $=\operatorname{BINOMDIST}(x, n, p, c)$ " directly into the cell, where:
$x$ is the number of success in trials.
$n$ is the number of trials.
$p$ is the probability of success in each trial.
$c$ indicates whether the function is cumulative (TRUE or 1 ) or not cumulative(FALSE or 0 ).

For example:

$$
\begin{array}{ll}
\text { To evaluate } \operatorname{pr}(X=5) & \text { In cell A1, type: =BINOMDIST(5, 8, 0.6, 0) } \\
\text { To evaluate } \operatorname{pr}(X \leq 3) & \text { In cell B1, type: =BINOMDIST(3, 8, 0.6, 1) } \\
\text { To evaluate } \operatorname{pr}(X \geq 3) & \text { In cell C1, type: =BINOMDIST(2, 8, 0.6, 1) } \\
& \text { In cell C2, type: =1-C1 } \\
\text { To evaluate } \operatorname{pr}(3 \leq X \leq 6) & \begin{array}{l}
\text { In cell D1, type: =BINOMDIST(6, 8, 0.6, 1) } \\
\\
\\
\text { In cell D2, type: =BINOMDIST(2, 8, 0.6, 1) } \\
\text { In cell D3, type: =D1 - D2 }
\end{array}
\end{array}
$$

|  | A | B | $C$ | D |
| :---: | :---: | :---: | :--- | :--- |
| 1 | $=\operatorname{BINOMDIST}(5,8,0.6,0)$ | $=\operatorname{BINOMDIST}(3,8,0.6,1)$ | $=\operatorname{BINOMDIST}(2,8,0.6,1)$ | $=\operatorname{BINOMDIST}(6,8,0.6,1)$ |
| 2 |  |  | $=1-\mathrm{C} 1$ | $=\operatorname{BINOMDIST}(2,8,0.6,1)$ |
| 3 |  |  |  | $=\operatorname{Din} 1-\mathrm{D} 2$ |

## Calculating Poisson Probabilities

A. Individual probabilities: $\operatorname{pr}(X=x)$

Example: Find $\operatorname{pr}(X=5)$ where $X \sim \operatorname{Poisson}(\lambda=3)$

1. Click cell A1.
2. Click the Paste Function button
3. Choose Statistical from the
from the tool bar.
Function category list box in the Paste Function dialog box.
4. Choose POISSON from the Function name list box (Figure 1).

Figure 1
5. Click OK.
6. Fill in the POISSON dialog box (Figure 2).

## Figure 2

where:
$\mathbf{X}$ is the number of events. It is equivalent to $x$ in our manual. In this example, we put 5 in this box.

Mean is the mean of the distribution. It is equivalent to $\lambda$ in our manual. In this example, we put 3 in this box.

Cumulative indicates whether the Poisson probability is cumulative (TRUE or 1 ) or not(FALSE or 0 ). Since the individual probability is not cumulative, we put FALSE in this box.
7. Click OK. (The value of 0.101 should appear in cell A1).
B. Lower tail probabilities: $\operatorname{pr}(\boldsymbol{X} \leq \boldsymbol{x})$

Example: Find $\operatorname{pr}(X \leq 5)$ where $X \sim \operatorname{Poisson}(\lambda=3)$

1. Click cell B1.
2. Follow Steps 1 to 4 in A.
3. Set: $X=5$

Mean $=3$
4. The lower tail probability is cumulative, hence we set

Cumulative $=$ TRUE .
5. Click OK. (The value of 0.916 should appear in cell B1).
C. Upper tail probabilities: $\operatorname{pr}(X \geq x)$

Example: Find $\operatorname{pr}(X \geq 5)$ where $X \sim \operatorname{Poisson}(\lambda=3)$
Note: $\quad \operatorname{pr}(X \geq 5)=1-\operatorname{pr}(X \leq 4)$

1. Evaluate $\operatorname{pr}(X \leq 2)$ in cell C 1 (use steps in B ).
2. In cell C2, type: $=\mathbf{1 - C 1}$.
3. Press Enter. (The value of 0.185 should appear in cell C2).
D. $\mathbf{p r}(\mathbf{a} \leq \boldsymbol{X} \leq \mathbf{b})$

Example: Find $\operatorname{pr}(2 \leq X<9)$ where $X \sim \operatorname{Poisson}(\lambda=3)$
Note: $\quad \operatorname{pr}(2 \leq X<9)=\operatorname{pr}(2 \leq X \leq 8)=\operatorname{pr}(X \leq 8)-\operatorname{pr}(X \leq 1)$

1. Evaluate $\operatorname{pr}(X \leq 8)$ in cell D 1 (use steps in B ).
2. Evaluate $\operatorname{pr}(X \leq 1)$ in cell D 2 (use steps in B ).
3. In cell D3, type: $=\mathbf{D} 1-\mathbf{D} 2$.
4. Press Enter. (The value of 0.797 should appear in cell D3).

## Note:

Another way to calculate Poisson probabilities is to type the function " $=\operatorname{POISSON}(x, \lambda, c)$ " directly into the cell, where:
$x$ is the number of events.
$\lambda$ is the mean of the distribution.
$c$ indicates whether the function is cumulative (TRUE or 1) or not cumulative(FALSE or 0).

For example:

| To evaluate $\operatorname{pr}(X=5)$ | In cell A1, type: $=\mathbf{P O I S S O N}(\mathbf{5}, \mathbf{3 , 0}$ ) |
| :---: | :---: |
| To evaluate $\operatorname{pr}(X \leq 5)$ | In cell B1, type: $=\operatorname{POISSON}(\mathbf{5}, \mathbf{3}, \mathbf{1})$ |
| To evaluate $\operatorname{pr}(X \geq 5)$ | $\begin{aligned} & \text { In cell C1, type: }=\mathbf{P O I S S O N}(\mathbf{4}, \mathbf{3}, \mathbf{1}) \\ & \text { In cell C2, type: }=\mathbf{1}-\mathbf{C} 1 \end{aligned}$ |
| To evaluate $\operatorname{pr}(2 \leq X \leq 8)$ | In cell D1, type: $=\operatorname{POISSON}(\mathbf{8}, \mathbf{3}, \mathbf{1})$ <br> In cell D2, type: $=\operatorname{POISSON}(\mathbf{1}, \mathbf{3}, \mathbf{1})$ <br> In cell D3, type: =D1 - D2 |

|  | A | B | C | D |
| :---: | :---: | :---: | :---: | :---: |
| 1 | $=\operatorname{POISSON}(5,3,0)$ | $=\operatorname{POISSON}(5,3,1)$ | $=\operatorname{POISSON}(4,3,1)$ | $=\operatorname{POISSON}(8,3,1)$ |
| 2 |  |  | $=1-\mathrm{C1}$ | $=\operatorname{POISSON}(1,3,1)$ |
| 3 |  |  |  | $=\operatorname{D1-D2}$ |

## Figure 3

## Calculating Normal Probabilities

## A. Lower tail probabilities: $\operatorname{pr}(X \leq x)$

Example: Find $\operatorname{pr}(X \leq 5)$ where $X \sim \operatorname{Normal}(\mu=7, \sigma=6)$

1. Click in cell A1.
2. Click the Paste Function button $\boldsymbol{f}_{\boldsymbol{*}}$ from the tool bar.
3. Choose Statistical from the Function category list box in the Paste Function dialog box.
4. Choose NORMDIST from the Function name list box (Figure 1).

Figure 1

## 5. Click OK.

6. Fill in the NORMDIST dialog box (Figure 2).

Figure 2
where:
is the value for which we want the distribution. It is equivalent to $x$ in our manual. In this example, we put 5 in this box.

Mean is the mean of the distribution. It is equivalent to $\mu$ in our manual. In this example, we put 7 in this box.

Standard_dev is the standard deviation of the distribution. It is equivalent to $\sigma$ in our manual. In this example, we put 6 in this box.

Cumulative indicates whether we want it is cumulative distribution function(TRUE or 1) or probability mass function(FALSE or 0 ). We will always put TRUE or 1 in this box.
7. Click OK. (The value of 0.369 should appear in cell A1.)
B. Upper tail probabilities: $\operatorname{pr}(X \geq x)$

Example: Find $\operatorname{pr}(X \geq 9)$ where $X \sim \operatorname{Normal}(\mu=7, \sigma=6)$

Note: $\quad \operatorname{pr}(X \geq 9)=1-\operatorname{pr}(X \leq 9)$

1. Evaluate $\operatorname{pr}(X \leq 9)$ in cell B 1 (use steps in section A . above.).
2. In cell B2, type: $=\mathbf{1} \mathbf{- B 1}$.
3. Press Enter. (The value of 0.369 should appear in cell B2.)
4. C. $\mathbf{p r}(\mathbf{a} \leq X \leq$ b)

Example: Find $\operatorname{pr}(5 \leq X \leq 11)$ where $X \sim \operatorname{Normal}(\mu=7, \sigma=6)$

Note: $\quad \operatorname{pr}(5 \leq X \leq 11)=\operatorname{pr}(X \leq 11)-\operatorname{pr}(X \leq 5)$

1. Evaluate $\operatorname{pr}(X \leq 11)$ in cell C 1 (use steps in section A . above.).
2. Evaluate $\operatorname{pr}(X \leq 5)$ in cell C 2 (use steps in section A . above).
3. In cell C3, type: $=\mathbf{C 1} \mathbf{- C 2}$.
4. Press Enter. (The value of 0.378 should appear in cell C3.)

Note:

Another way to calculate Normal probabilities is to type the function " $=\operatorname{NORMDIST}(x, \mu, \sigma, c)$ " directly into a cell, where:
$x$ is the value for which we want the distribution.
$\mu$ is the mean of the distribution.
$\sigma$ is the standard deviation of the distribution
$c$ is always set the value at 1 .

For example:
To evaluate $\operatorname{pr}(\mathrm{X} \leq 5): \quad$ In cell A1, type: $=\operatorname{NORMDIST}(\mathbf{5}, \mathbf{7}, \mathbf{6}, \mathbf{1})$.
To evaluate $\operatorname{pr}(\mathrm{X} \geq 9)$ : In cell B1, type: $=\operatorname{NORMDIST}(\mathbf{9}, \mathbf{7}, \mathbf{6}, \mathbf{1})$
In cell B2, type: $\mathbf{1 - B 1}$.
To evaluate $\operatorname{pr}(5 \leq \mathrm{X} \leq 11)$ : In cell C1, type: =NORMDIST(11, 7, 6, 1).
In cell C2, type: $=\operatorname{NORMDIST}(\mathbf{5}, \mathbf{7}, \mathbf{6}, \mathbf{1})$.
In cell C3, type: C1-C2.

|  | A | B | C |
| :---: | :--- | :--- | :--- |
| 1 | $=\operatorname{NORMDIST}(5,7,6,1)$ | $=\operatorname{NORMDIST}(9,7,6,1)$ | $=\operatorname{NORMDIST}(11,7,6,1)$ |
| 2 |  | $=1-\mathrm{B} 1$ | $=\operatorname{NORMDIST}(5,7,6,1)$ |
| 3 |  |  | $=\mathrm{C} 1-\mathrm{C} 2$ |

Figure 3

## Calculating the Inverse of the Normal Distribution

Sometimes the $x$-value for a specified probability is required.
Example: What mark would a student have to get more than, in order to be in the top $25 \%$ of the class, if the mean mark was 65 out of 100 and the standard deviation is 9 .

1. Click in cell A1.
2. Click the Paste Function button from the tool bar.
3. Choose Statistical from the Function category list box in the Paste Function dialog box.
4. Choose NORMINV from the Function name list box (Figure 4).

Figure 4
5. Click OK.
6. Fill in the NORMINV dialog box (Figure 5).

Figure 5
Note the Excel function NORMINV determines the $x$-value for the probability that is to the left of the : required $x$-value. In this example we want the top $25 \%$ therefore we use $1-0.25$, or 0.75 for the probability. If instead we wanted the bottom $25 \%$ the probability is 0.25 .
7. Click OK. (The value of 71.0704 should appear in cell A1.)

Note:

The formula can be directly entered into the cell by typing " $=\operatorname{NORMINV}(p, \mu, \sigma)$ ", where:
$p$ is the probability to the left of the $x$-value being calculated
$\mu$ is the mean of the distribution
$\sigma$ is the standard deviation of the distribution

## Note:

Excel has two other functions that work in the same manner as the functions explained above. These two functions are NORMSDIST and NORMSINV. These two functions calculate the value for a standard normal distribution, ie. $X \sim \operatorname{Normal}(0,1)$.

## Generating Random Samples

Example:
Generate a random sample of 20 numbers that are Normally distributed with mean, $\mu=3$, and standard deviation, $\sigma=1.5$.

1. Make A1 the active cell. On the menu bar Click Edit 玉 Data Analysis
2. The Data Analysis dialog box is brought up. Select Random Number Generation as shown in Figure 1 below. Click OK.

Figure 1
3. The Random Number Generation dialog box appears. The Number of variables is $\mathbf{1}$. The Number of random numbers is $\mathbf{2 0}$, and use your ID number as the Random seed. The Distribution is the Normal distribution with a Mean of $\mathbf{3}$ and Standard deviation of 1.5. The Output range is A1.

Figure 2
4. There should be 20 numbers in cells A1:A20. The same tool can be used to generate random samples from the Poisson and the Binomial distributions.
5. To generate 20 numbers from a Binomial distribution with 10 trials and a probability of success equal to 0.25 , fill in the Random Number Generation dialog box as seen below in Figure 3.

Figure 3
6. To generate 20 numbers that come from a Poisson distribution with lambda equal to 2 , fill in the Random Number Generation dialog box as shown below.

Figure 3

## Example:

To investigate the distribution of the sample mean we will use Excel to simulate the rolling of a fair sixsided die. We will find the average (mean) outcome in a sample consisting of 4 throws. We will repeat this 300 times giving us 300 samples from which we will have 300 sample means. We will also use Excel to calculate some summary statistics and to construct a histogram of these 300 sample means.

1. Enter the headings shown below in Figure 1 into an Excel worksheet.

|  | A | B | C | D | E | F | G | H |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Sample | Outcomes |  |  |  | Sample Means |  |  |
| 2 | Number | 1st Roll | 2nd Roll | 3rd Roll | 4th Roll |  |  |  |

Figure 1
2. Enter $\mathbf{1}$ in cell A3 and $\mathbf{2}$ in cell A4. Highlight these two cells. Move the mouse cursor over the black box in the bottom right hand corner of the highlighted cells so that a black plus sign is seen, as shown in Figure 2. Hold the mouse buttom down and drag down to cell A302.

|  | $\mathbf{A}$ | B |
| :---: | :---: | :---: |
| 1 | Sample |  |
| 2 | Number | 1st Roll |
| 3 |  |  |
| 4 |  | 1 |
| 5 |  |  |
|  |  |  |

Figure 2
3. In cells $\mathrm{A} 3: \mathrm{A} 302$ should be the numbers 1-300.
4. In cell B3 enter the formula $=\mathbf{T R U N C}(\mathbf{R A N D}() * \mathbf{6 + 1})$
5. In the same manner as Step 2 above, drag the formula in cell B3 across cells C3, D3 to E3. This can be seen in Figure 3.

|  | A | B | C | D | E |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Sample | Outcomes |  |  |  |
| 2 | Number | 1st Roll | 2nd Roll | 3rd Roll | 4th Roll |
| 3 | 1 | $=T R U N C(R A N D O * 6+1)$ | $=$ TRUNC(RAND()*6+1) | $=T R U N C(R A N D() * 6+1)$ | $=$ TRUNC(RAND()*6+1) |

Figure 3
6. Enter the formula $=\mathbf{A V E R A G E}(\mathbf{B 3}: \mathbf{E 3})$ in cell G3. (See Figure 4.)

| F | G |
| :---: | :---: |
|  | Sample Means |
|  |  |
|  | AVERAGE(B3:ES) |
|  |  |

Figure 4
7. Select cells B3:G3. Using the method in Step 2, drag the formulas in the selected cells down to row 302. The first few rows will look similar to the figure below. The values should be different due to the fact that a random number generator is being used.

|  | A | B | C | D | E | F | G | H |  |  |
| :---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| 1 | Sample | Outcomes |  |  |  |  |  |  |  |  |
| 2 | Number | 1st Roll | 2nd Roll | 3rd Roll | 4th Roll |  |  | Sample Means |  |  |
| 3 | 1 | 6 | 1 | 4 | 5 |  | 4 |  |  |  |
| 4 | 2 | 5 | 3 | 3 | 3 |  | 3.5 |  |  |  |
| 5 | 3 | 2 | 6 | 2 | 6 |  | 4 |  |  |  |
| 6 | 4 | 1 | 2 | 4 | 5 |  | 3 |  |  |  |
| 7 | 5 | 4 | 5 | 3 | 5 |  | 4.25 |  |  |  |
| 8 | 6 | 6 | 5 | 5 | 6 |  | 5.5 |  |  |  |
| 9 | 7 | 3 | 4 | 1 | 2 |  | 2.5 |  |  |  |
| 10 | 8 | 6 | 4 | 5 | 1 |  | 4 |  |  |  |

Figure 5
8. Set up the heading in the cells shown below in figure 6 .

|  | I | J | K | L | M |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | Mean | Frequency |  | Summary Statistics |  |
| 2 |  |  |  | Mean |  |
| 3 |  |  |  | Std Dev |  |
| 4 |  |  |  |  |  |

Figure 6
9. In cell M2 enter the formula =AVERAGE(G3:G302) and in cell M3 enter the formula $=\mathbf{S T D E V}(\mathbf{G 3}: \mathbf{G 3 0 2})$ (Figure 7.)

|  | L | M |
| :---: | :--- | :--- |
| 1 | Summary Statistics |  |
| 2 | Mean | $=$ AVERAGE $(03: 0302)$ |
| 3 | Std Dev | $=$ STDEV $(03: 0302)$ |

Figure 7
10. Enter $\mathbf{1}$ and $\mathbf{1 . 2 5}$ in cells I2 and I3 respectively. Highlight cells I2and I3. In the same manner as that described in Step 2, drag the values down to cell I22, so that the worksheet looks like the figure below.

|  | I |  |
| :---: | ---: | :--- |
| 1 | Mean | Frequency |
| 2 |  | 1 |
| 3 | 1.25 |  |
| 4 | 1.5 |  |
| 5 | 1.75 |  |
| 6 | 2 |  |
| 7 | 2.25 |  |
| 8 | 2.5 |  |
| 9 | 2.75 |  |
| 10 | 3 |  |
| 11 | 3.25 |  |
| 12 | 3.5 |  |
| 13 | 3.75 |  |
| 14 | 4 |  |
| 15 | 4.25 |  |
| 16 | 4.5 |  |
| 17 | 4.75 |  |
| 18 | 5 |  |
| 19 | 5.25 |  |
| 20 | 5.5 |  |
| 21 | 5.75 |  |
| 22 | 6 |  |

Figure 8
11. Select cells J2:J22. Type =FREQUENCY(G3:G302,I2:I22) while the cells are still selected, but do not press the Enter key. Then while holding down the Shift and the Control key, press the Enter key. The selected cells will now contain the counts (yours will be different) of the corresponding mean in column I, as seen in Figure 9.

|  | 1 |  | $J$ |
| ---: | ---: | ---: | ---: |
| 1 | Mean |  | Frequency |
| 2 |  | 1 | 0 |
| 3 | 1.25 | 0 |  |
| 4 | 1.5 | 2 |  |
| 5 | 1.75 | 10 |  |
| 6 | 2 | 4 |  |
| 7 | 2.25 | 13 |  |
| 8 | 2.5 | 17 |  |
| 9 | 2.75 | 24 |  |
| 10 | 3 | 36 |  |
| 11 | 3.25 | 33 |  |
| 12 | 3.5 | 34 |  |
| 13 | 3.75 | 38 |  |
| 14 | 4 | 26 |  |
| 15 | 4.25 | 20 |  |
| 16 | 4.5 | 24 |  |
| 17 | 4.75 | 7 |  |
| 18 | 5 | 6 |  |
| 19 | 5.25 | 5.5 | 5 |
| 20 | 5.75 | 0 |  |
| 21 | 6 | 1 |  |
| 22 |  | 0 | 0 |

Figure 9
12. Highlight cells J2:J22. Click the Chart Wizard button The Chart Wizard dialog box pops up. Choose the Column Chart type and the Chart sub-type indicated in the Figure 10 below. Click Next.

Figure 10
13. The next Chart Wizard dialog box appears. Click on the Series tab. In the Category ( $\mathbf{X}$ ) axis labels box type $=$ Sheet1! $\mathbf{\$ I} \mathbf{2} \mathbf{2} \mathbf{\$ I} \mathbf{\$ 2 2}$ Click Next.

Figure 11
14. Another Chart Wizard dialog box is brought up (Figure 12). The Chart title is Distribution of Sample Means, the Category ( $\mathbf{X}$ ) axis is Sample Mean, and the Value ( $\mathbf{Y}$ ) axis is frequency. Remove the Gridlines and the Legend. Click Next.

Figure 12
15. The last dialog box is shown. Ensure that the chart will be put on the current sheet. Then click Finish.

## Calculating Student $\boldsymbol{t}$-Probabilities

A. Upper tail probabilities: $\operatorname{pr}(T \geq t)$

Example: Find $\operatorname{pr}(T \geq 2)$ where $T \sim \operatorname{Student}(d f=9)$

1. Click in cell A1.
2. Click the Paste Function button $\boldsymbol{f}_{\boldsymbol{*}}$ from the tool bar.
3. Choose Statistical from the Function category list box in the Paste Function dialog box.
4. Choose TDIST from the Function name list box (Figure 1).

Figure 1
5. Click OK.
6. Fill in the TDIST dialog box (Figure 2).

Figure 2
where: this example, we put 2 in this box.

Deg_freedo is the number of degrees of freedom. In this example, we put 29 in this box. m

Tails is the number of tails required either 1 or 2 . In this example, we put 1 in this box.
7. Click OK. (The value of 0.038 should appear in cell A1.)

## B. Lower tail probabilities: $\operatorname{pr}(\boldsymbol{T} \leq \boldsymbol{t})$

Example: Find $\operatorname{pr}(T \leq 1)$ where $T \sim \operatorname{Student}(d f=9)$

Note: $\quad \operatorname{pr}(T \leq 1)=1-\operatorname{pr}(T \geq 1)$

1. Evaluate $\operatorname{pr}(T \geq 1)$ in cell B1 (use steps in section A. above.).
2. In cell B2, type: $=\mathbf{1} \mathbf{- B 1}$.
3. Press Enter. (The value of 0.828 should appear in cell B2.)
4. $\mathbf{C} \cdot \operatorname{pr}(\mathbf{a} \leq \boldsymbol{T} \leq \mathrm{b})$

Example: Find $\operatorname{pr}(0 \leq T \leq 1)$ where $T \sim \operatorname{Student}(d f=9)$

Note: $\quad \operatorname{pr}(0 \leq T \leq 1)=\operatorname{pr}(T \geq 0)-\operatorname{pr}(T \geq 1)$

1. Evaluate $\operatorname{pr}(T \geq 0)$ in cell C 1 (use steps in section A . above.).
2. Evaluate $\operatorname{pr}(T \geq 1)$ in cell C 2 (use steps in section A. above.).
3. In cell C3, type: $=\mathbf{C 1} \mathbf{- C 2}$.
4. Press Enter. (The value of 0.328 should appear in cell C3.)

Another way to calculate Student $t$-probabilities is to type the function " $=\operatorname{TDIST}(x, d f$, tails)" directly into a cell, where:
$x$ is the value for which we want the distribution.
$d f \quad$ is the number of degrees of freedom of the distribution.
tails specifies whether one tail or two tails are to be calculated

For example:
To evaluate $\operatorname{pr}(\mathrm{X} \leq 2): \quad$ In cell A1, type: $=$ TDIST $(\mathbf{2}, \mathbf{9}, \mathbf{1})$.
To evaluate $\operatorname{pr}(X \geq 1)$ : $\quad$ In cell B1, type: $=$ TDIST $(\mathbf{1}, \mathbf{9}, \mathbf{1})$
In cell B2, type: $\mathbf{1 - B 1}$.
To evaluate $\operatorname{pr}(0 \leq X \leq 1)$ : In cell C1, type: $=\operatorname{TDIST}(\mathbf{0}, \mathbf{9}, \mathbf{1})$.
In cell C2, type: $=\operatorname{TDIST}(\mathbf{1}, \mathbf{9}, \mathbf{1})$.
In cell C3, type: C1 - C2.

|  | A | B | C |
| :---: | :--- | :--- | :--- |
| 1 | $=\operatorname{TDIST}(2,9,1)$ | $=\operatorname{TDIST}(1,9,1)$ | $=\operatorname{TDIST}(0,9,1)$ |
| 2 |  | $=1-\mathrm{B} 1$ | $=\operatorname{TDIST}(1,9,1)$ |
| 3 |  |  | $=\mathrm{C} 1-\mathrm{C} 2$ |

Figure 3

## Calculating the Inverse of the Student $\boldsymbol{t}$-distribution

Example: Find the $t$-value $t_{30}(0.025)$ ie. Probability 0.025 and 30 degrees of freedom for use in a $95 \%$ confidence interval as the $t$-multiplier.

1. Click on cell A1.
2. Click the Paste Function button from the tool bar.
3. Choose Statistical from the Function category list box in the Paste Function dialog box.
4. Choose TINV from the Function name list box (Figure 4).

Figure 4

## 5. Click OK

6. Fill in the TINV dialog box (figure 5).

Figure 5

## Note:

The Excel function TINV calculates the $t$-value for two-tailed $t$-distribution. So if we want to find the $t$ value whose probability to the right is 0.1 , then in the TINV function the value for the probability is entered as 0.2 , because of the two-tailed nature of the function.
7. Click OK. (The value 2.042 should appear in cell A1.)

## Note:

The examples can be solved by directly typing the formula " $=\operatorname{TINV}(p, d f)$ " into the cell, where:
$p$ is the probability for the two-tailed distribution
$d f$ is the number of degrees of freedom for the distribution

## $t$-Test of Means for Two Independent Samples

Example:
Perform a $t$-test on the Urinary Androsterone Levels Data. (Refer to example 10.2.1 in your textbook.)

1. Enter the data into Excel as shown in Figure 1 below.

|  | A | B |
| :---: | ---: | ---: |
| 1 | heterosexual | homosexual |
| 2 | 3.9 | 2.5 |
| 3 | 4 | 1.6 |
| 4 | 3.8 | 3.9 |
| 5 | 3.9 | 3.4 |
| 6 | 2.9 | 2.3 |
| 7 | 3.2 | 1.6 |
| 8 | 4.6 | 2.5 |
| 9 | 4.3 | 3.4 |
| 10 | 3.1 | 1.6 |
| 11 | 2.7 | 4.3 |
| 12 | 2.3 | 2 |
| 13 |  | 1.8 |
| 14 |  | 2.2 |
| 15 |  | 3.1 |
| 16 |  | 1.3 |

Figure 1
2. From the menu bar select Tools £ Data Analysis...
3. Select the t-Test: Two-Sample Assuming Unequal Variances from the Analysis Tools list box seen in Figure 2.

Figure 2
4. Click OK.
5. The dialog box below is brought up. In the Variable 1 range box enter A1:A12, and in the Variable 2 range box enter B1:B16. The Hypothesized mean difference is 0 . Mark the Labels checkbox. And the Output range is A20.

Figure 3
6. Click OK. The results will appear on the worksheet as in Figure 4.

|  | A | B | C |
| :--- | :--- | ---: | ---: |
| 20 | t-Test: Two-Sample Assuming Unequal Variances |  |  |
| 21 |  |  |  |
| 22 |  | heterosexual | homosexual |
| 23 | Mean | 3.51818182 | 2.5 |
| 24 | Variance | 0.51963636 | 0.85142857 |
| 25 | Observations | 11 | 15 |
| 26 | Hypothesized Mean Difference | 0 |  |
| 27 | df | 24 |  |
| 28 | t Stat | 3.1572239 |  |
| 29 | P(T<=t) one-tail | 0.00212947 |  |
| 30 | t Critical one-tail | 1.71088232 |  |
| 31 | P(T<=t) two-tail | 0.00425893 |  |
| 32 | t Critical two-tail | 2.06389814 |  |

Figure 4

## $t$-Test of Means for Paired Data

Example:
Perform a $t$-test on the Airforce Headsizes Data. (Refer to Example 10.1.3 in your textbook.)

1. Enter the data seen in Figure 1 into Excel.

|  | A |  | B | C |
| :---: | ---: | ---: | ---: | ---: |
| 1 | recruit | cardboard |  | metal |
| 2 |  | 1 | 146 | 145 |
| 3 | 2 | 151 | 153 |  |
| 4 |  | 3 | 163 | 161 |
| 5 | 4 | 152 | 151 |  |
| 6 |  | 5 | 151 | 145 |
| 7 | 6 | 151 | 150 |  |
| 8 | 7 | 149 | 150 |  |
| 9 | 8 | 166 | 163 |  |
| 10 | 9 | 149 | 147 |  |
| 11 | 10 | 155 | 154 |  |
| 12 | 11 | 155 | 150 |  |
| 13 | 12 | 156 | 156 |  |
| 14 | 13 | 162 | 161 |  |
| 15 | 14 | 150 | 152 |  |
| 16 | 15 | 156 | 154 |  |
| 17 | 16 | 158 | 154 |  |
| 18 | 17 | 149 | 147 |  |
| 19 | 18 | 163 | 160 |  |

Figure 1
2. From the menu bar select Tools £ Data Analysis...
3. The Data Analysis dialog box is brought up. From the Analysis Tools list box select t-Test: Paired Two Sample for Means.(See Figure 2). Click OK.

## Data Analysis

Figure 2
4. The following dialog box is shown (Figure 3). In the Variable 1 range box enter B1:B19, and in the Variable 2 range box enter C1:C19. Mark the Labels checkbox. The Hypothesized mean difference is 0 . The Output range is A23.

Figure 3
5. Click OK. The results will appear as in Figure 4 below.

|  | A | B | C |
| :--- | :--- | ---: | ---: |
| 23 | t-Test: Paired Two Sample for Means |  |  |
| 24 |  |  |  |
| 25 |  | cardboard | metal |
| 26 | Mean | 154.555556 | 152.944444 |
| 27 | Variance | 33.9084967 | 30.6437908 |
| 28 | Observations | 18 | 18 |
| 29 | Pearson Correlation | 0.92985902 |  |
| 30 | Hypothesized Mean Difference | 0 |  |
| 31 | df | 17 |  |
| 32 | t Stat | 3.1854219 |  |
| 33 | P(T<=t) one-tail | 0.00270736 |  |
| 34 | t Critical one-tail | 1.73960643 |  |
| 35 | P(T<=t) two-tail | 0.00541472 |  |
| 36 | $t$ Critical two-tail | 2.10981852 |  |

Figure 4

Example: Construct one-way ANOVA table for the Cancer Data.

1. Enter the information as Figure 1 below.

|  | A | B | C |
| :--- | ---: | ---: | ---: |
| 1 | Stomach | Bronchus | Colon |
| 2 | 1.18 | 0.81 | 2.01 |
| 3 | -0.41 | 3.16 | 0.51 |
| 4 | -0.64 | -0.22 | 1.07 |
| 5 | 1.32 | 2.05 | 4.31 |
| 6 | 1.39 | 1.9 | 1 |
| 7 | 0.14 | 0.85 | 3.51 |
| 8 | 2.29 | 0.27 | 3 |
| 9 | -0.1 | 0.73 | 1.79 |
| 10 | 2.2 | 1.84 | 1.67 |
| 11 | 3.83 | 3.86 | 2.16 |

## 4. Figure 1

2. From the Menu bar, select Tool - Data Analysis.
3. Choose Anova: Single Factor from the Data Analysis dialog box. (Figure 2)

## 5. Figure 2

4. Click OK.
5. In the Input box, we set:

6. In the Output options, choose New Worksheet Ply. The ANOVA table will be produced on a new worksheet. The Anova: Single Factor dialog box should look like Figure 3.

Figure 3
7. Click OK. The ANOVA table in Figure 4 should appear on a new worksheet.

|  | A | B | C | D | E | F | G |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Anova: Single Factor |  |  |  |  |  |  |

Figure 4

## Chi-square Test

## One-Dimensional Tables

Example: Perform a Chi-square test for goodness of fit on the Rolls of a Die Data. (Refer to example 11.1.1 in your textbook.)

1. Enter the data into Excel as done in Figure 1. Also enter the formula $=\mathbf{S U M}(\mathbf{B 2}$ : $\mathbf{B 7}$ ) into cell B8.

|  | A |  |
| :--- | :--- | :--- |
| 1 | outcome B |  |
| 2 | 1 | count |
| 3 | 2 | 26 |
| 4 | 3 | 40 |
| 5 | 4 | 37 |
| 6 | 5 | 26 |
| 7 | 6 | 43 |
| 8 |  | 38 |

Figure 1
2. Enter expected into cell C 1 . Then enter the formula $=\$ \mathbf{B} \$ \mathbf{8} / 6$ into cells $\mathrm{C} 2: \mathrm{C} 7$.

| C |
| :--- |
| expeeted |
| $=\$ \mathrm{~B} \$ 8 / 6$ |
| $=\$ \mathrm{~B} \$ 8 / 6$ |
| $=\$ \mathrm{~B} \$ 8 / 6$ |
| $=\$ \mathrm{~B} \$ 8 / 6$ |
| $=\$ \mathrm{~B} \$ 8 / 6$ |
| $=\$ \mathrm{~B} \$ 8 / 6$ |

Figure 2
3. In cell A10 type $=\mathbf{C H I T E S T}(\mathbf{B 2} \mathbf{B} \mathbf{B 7 , C 2 : C 7 )}$ as seen in Figure 3.

| 9 |  |
| :---: | :--- |
| 10 | $=C H I T E S T(B 2: B 7, C 2: C 7)$ |
| 11 |  |

Figure 3
4. Once all the formulas have been entered, the Excel worksheet will look like the figure below. Cell A10 contains the $P$-value for the goodness of fit test.

|  | A |  | B |  | C |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | outcome | count | expected |  |  |
| 2 |  | 1 |  | 26 | 35 |
| 3 |  | 2 |  | 40 | 35 |
| 4 |  | 3 |  | 37 | 35 |
| 5 |  | 4 |  | 26 | 35 |

Figure 4

## Two-Dimensional Tables

## Example:

Perform a Chi-square test of homogeneity on the Phenotype Regional Data. The method described below can also be used to perform a test of independence. (Refer to example 11.2.2 in your textbook.)

|  | Phenotype |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Region | A | B | O | AB | Totals |
| Nithsdale | 98 | 35 | 115 | 5 | 253 |
| Cree | 38 | 9 | 79 | 6 | 132 |
| Rhinns | 36 | 9 | 47 | 7 | 99 |
| Totals | 172 | 53 | 241 | 18 | 484 |

1. Enter the above data into Excel in the manner shown in the figure below.

|  | A | B | C | D | E | F |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | observed | A | B | 0 | AB | Totals |
| 2 | Nithsdale | 98 | 35 | 115 | 5 | 253 |
| 3 | Cree | 38 | 9 | 79 | 6 | 132 |
| 4 | Rhinns | 36 | 9 | 47 | 7 | 99 |
| 5 | Totals | 172 | 53 | 241 | 18 | 484 |

Figure 5
2. In cells B8:E10, enter the formulas seen below.

| 7 | expected | A | B | 0 | AB |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 8 | Nithsdale | $=(\$ \mathrm{~F} \$ 2 * \mathrm{~B} 5) / \$ \mathrm{~F} \$ 5$ | $=(\$ \mathrm{~F} \$ 2 * \mathrm{C}) / \$ \mathrm{~F} \$ 5$ | $=(\$ \mathrm{~F} \$ 2 * \mathrm{D} 5) / \$ \mathrm{~F} \$ 5$ | $=(\$ \mathrm{~F} \$ 2 * \mathrm{E}) / / \$ \mathrm{~F} \$ 5$ |
| 9 | Cree | $=(\$ \mathrm{~F} \$ 3 * \mathrm{~B} \$ 5) / \$ \mathrm{~F} \$ 5$ | $=(\$ \mathrm{~F} \$ 3 * \mathrm{C} \$ 5) / \$ \mathrm{~F} \$ 5$ | $=(\$ \mathrm{~F} \$ 3 * \mathrm{D} \$ 5) / \$ \mathrm{~F} \$ 5$ | $=(\$ \mathrm{C} \$ 3 * \mathrm{E} \$ 5) / \$ \mathrm{~F} \$ 5$ |
| 10 | Rhinns | $=(\$ \mathrm{~F} \$ 4 * \mathrm{~B} \$ 5) / \$ \mathrm{~F} \$ 5$ | $=(\$ \mathrm{~F} \$ 4 * \mathrm{C} \$ 5) / \$ \mathrm{~F} \$ 5$ | $=(\$ \mathrm{~F} \$ 4 * \mathrm{D} \$ 5) /(\$ \mathrm{~F} \$ 5$ | $=(\$ \mathrm{~F} \$ 4 * \mathrm{E} \$ 5) / \$ \mathrm{~F} \$ 5$ |

Figure 6
3. The results will then be displayed in the worksheet as shown in Figure 7.

| 7 | expected | A | B | 0 | AB |
| :---: | :--- | :--- | :--- | :--- | :--- |
| 8 | Nithsdale | 89.9091 | 27.7045 | 125.977 | 9.40909 |
| 9 | Cree | 46.9091 | 14.4545 | 65.7273 | 4.90909 |
| 10 | Rhinns | 35.1818 | 10.8409 | 49.2955 | 3.68182 |

Figure 7
4. Select cell A13. Then on the tool bar click the Paste Function button
 The Paste Function dialog box is brought up. Choose Statistical from the Function category box, and then choose CHITEST from the Function name box. Click OK.

Figure 8
5. The CHITEST dialog box appears. The Actual_range is B2:E4, and the Expected_range is B8:E10. Click OK.

Figure 9
6. Finally the worksheet should look as in Figure 10. The $P$-value for the Chi-square test is found in cell A13 and the value is 0.015 .

|  | A | B | C | D | E | F |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | observed | A | B | 0 | AB | Totals |
| 2 | Nithsdale | 98 | 35 | 115 | 5 | 253 |
| 3 | Cree | 38 | 9 | 79 | 6 | 132 |
| 4 | Rhinns | 36 | 9 | 47 | 7 | 99 |
| 5 | Totals | 172 | 53 | 241 | 18 | 484 |
| 6 |  |  |  |  |  |  |
| 7 | expected | A | B | 0 | AB |  |
| 8 | Nithsdale | 89.9091 | 27.7045 | 125.977 | 9.40909 |  |
| 9 | Cree | 46.9091 | 14.4545 | 65.7273 | 4.90909 |  |
| 10 | Rhinns | 35.1818 | 10.8409 | 49.2955 | 3.68182 |  |
| 11 |  |  |  |  |  |  |
| 12 |  |  |  |  |  |  |
| 13 | 0.0150207 |  |  |  |  |  |

Figure 10

Example:
Perform simple linear regression on the Chernobyl Data. (Refer to example 3.1.1 in your textbook.)

1. Enter the Chernobyl data into Excel as seen in Figure 1.

|  | A |  | B |
| :---: | ---: | ---: | ---: |
| 1 | percent | radiation |  |
| 2 |  | 2.2 | 23 |
| 3 |  | 2.4 | 20 |
| 4 |  | 1.9 | 22 |
| 5 | 3.9 | 29 |  |
| 6 | 3.6 | 32 |  |
| 7 |  | 2.6 | 21 |
| 8 | 0 | 16 |  |
| 9 | 4.2 | 37 |  |
| 10 | 5 | 44 |  |

Figure 1
2. From the menu bar choose Tools then the Data Analysis option.
3. The Data Analysis dialog box appears (See Figure 2). Select Regression and then click OK.

Figure 2
4. Fill in the Regression dialog box as shown in Figure 3 below. The Input $Y$ range is A1:A10, and the Input $\mathbf{X}$ range is $\mathbf{B 1 : B 1 0}$. Mark the Labels checkbox. Mark the circle next to New workbook for the Output Options. Also mark the Residual plots checkbox.

Figure 3
5. Click OK. The regression analysis tool produces the output seen below in Figure 4.

|  | A | B | C | D | E | F | G | H | I |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | SUMMARY OUTPUT |  |  |  |  |  |  |  |  |
| 2 |  |  |  |  |  |  |  |  |  |
| 3 | Regression Statistics |  |  |  |  |  |  |  |  |
| 4 | Multiple R | 0.91165222 |  |  |  |  |  |  |  |
| 5 | R Square | 0.83110976 |  |  |  |  |  |  |  |
| 6 | Adjusted R Sq | 0.80698259 |  |  |  |  |  |  |  |
| 7 | Standard Erro | 0.65570289 |  |  |  |  |  |  |  |
| 8 | Observations | 9 |  |  |  |  |  |  |  |
| 9 |  |  |  |  |  |  |  |  |  |
| 10 | ANOVA |  |  |  |  |  |  |  |  |
| 11 |  | $d t$ | SS | MS | $F \quad$ Significance F |  |  |  |  |
| 12 | Regression | 1 | 14.810376 | 14.810376 | 34.4470379 | 0.00061847 |  |  |  |
| 13 | Residual | 7 | 3.009624 | 0.42994629 |  |  |  |  |  |
| 14 | Total | 8 | 17.82 |  |  |  |  |  |  |
| 15 |  |  |  |  |  |  |  |  |  |
| 16 |  | Coefficients | itandard Error | tStat | P -ralue | Lower 95\% | Upoer 95\% | Lower 95.0 \% | Upoer 95.0 W |
| 17 | Intercept | -1.1796123 | 0.72323094 | -1.6310313 | 0.14690466 | -2.8897805 | 0.5305559 | -2.8897805 | 0.5305559 |
| 18 | radiation | 0.14924799 | 0.02542919 | 5.8691599 | 0.00061847 | 0.08911755 | 0.20937844 | 0.08911755 | 0.20937844 |

Figure 4
6. Excel also produces a Residual plot. This plot needs to be enlarged to look like the plot shown below in Figure 5.

Figure 5

## Note:

The Normal probability plots are not the plots we are looking for as they are not normal plots for the residuals. So we ignore this option.

## Correlation

Example:
Determine the sample correlation coefficient of the Chernobyl Data. (Refer to example 3.1.1 in your textbook.)

1. Enter the data into Excel as seen below in Figure 1.

|  | $A$ |  |
| :---: | ---: | ---: |
| A |  |  |
| 1 | percent | radiation |
| 2 | 2.2 | 23 |
| 3 | 2.4 | 20 |
| 4 |  | 1.9 |
| 22 |  |  |
| 5 | 3.9 | 29 |
| 6 | 3.6 | 32 |
| 7 | 2.6 | 21 |
| 8 | 0 | 16 |
| 9 | 4.2 | 37 |
| 10 | 5 | 44 |

Figure 1
2. From the menu bar select Tools £ Data Analysis...
3. The Data Analysis dialog box is brought up. Select Correlation from the Analysis Tools list box seen in the figure below.

## Data Analysis

Analysis Tools
Anova: Single Factor
Anova: Two-Factor With Replication
Anova: Two-Factor Without Replication
Correlation

Descriptive Statistics
Exponential Smoothing
F -Test Two-Sample for Yariances

$\square$
Cancel

Help

Figure 2

## 4. Click OK.

5. Then the Correlation dialog box is brought up. The Input range is A1:B10. Mark the check box for Labels in the first row, and ensure that the circle next to Columns is marked as well. The Output range is A15.

## Correlation

Figure 3
6. Click OK. The results that Excel outputs can be seen below in Figure 4.

| 15 |  | percent | radiation |
| :--- | :--- | ---: | ---: |
| 16 | percent | 1 |  |
| 17 | radiation | 0.91165222 | 1 |

Figure 4
7. The sample correlation coefficient is contained in cell B17.

## Copying and Pasting Excel into Word

It is useful to be able to include parts of a Excel spreadsheet or an Excel graph in a Word document as part of a report or assignment.

Example:
The Excel regression output and the graph below needs to be placed into a report.

Figure 1

Figure 2

1. Select cells A1:G18. Click on the menu bar Edit $£$ Copy.
2. Then move over to Word. Place the blinking cursor at the spot that you wish the copied data to go. Click on the menu bar Edit $\ddagger$ Paste.
3. Once copied and pasted the regression output would look like the table below.

SUMMARY OUTPUT

| Regression Statistics |  |
| :--- | ---: |
| Multiple R | 0.91165222 |
| R Square | 0.83110976 |
| Adjusted R | 0.80698259 |
| Square |  |
| Standard | 0.65570289 |
| Error |  |
| Observations | 9 |

ANOVA

|  | $d f$ |  | SS | MS | $F$ |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Regression | 1 | 14.810376 | 14.810376 | 34.4470379 | 0.00061847 |
| Residual | 7 | 3.009624 | 0.42994629 |  |  |
| Total | 8 | 17.82 |  |  |  |

|  | Coefficients | Standard Error | $t$ Stat | $P$-value | Lower 95\% | Upper 95\% |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Intercept | -1.1796123 | 0.72323094 | -1.6310313 | 0.14690466 | -2.8897805 | 0.5305559 |
| radiation | 0.14924799 | 0.02542919 | 5.8691599 | 0.00061847 | 0.08911755 | 0.20937844 |

4. Activate Excel. Click on the white part of the graph near the edge. Small black squares appear around the edge of the graph. Copy the graph using the method described in Step 1.
5. Activate Word and place the blinking cursor in the spot that you want put the graph. Paste the copied graph as in Step 2.
6. The graph will then appear in the Word document.
